

What is Monarch Complete?

Monarch Complete is the combination of two Datawatch Data Preparation systems: Monarch Classic and Data Prep Studio. Together, these two interfaces enable users to access, extract, clean, blend, wrangle and join data from the widest variety of sources, including PDF reports.

With over 40,000 customers worldwide, Monarch is the leading self-service data extraction and manipulation tool that enables users to spend less time cleaning their data and more time working with it.

What is Content Server?

Datawatch Content Server is an enterprise-level data repository with segmentation capabilities which provides IT and management with governance features necessary for protecting sensitive data. The system enables Content Server administrators to assign data to various buckets and credentials to users to ensure that only the people who need certain data can access it. For example, the ability to replicate or mirror an existing active directory environment.

Content Server allows for a 'thin-client' application in which users can login to the system, grab the appropriate file and Monarch workspace or model and complete their report extraction and data preparation without the help of IT. Better yet, the Server provides IT with a log of all activity within the server, ensuring data governance of important features.

The platform enables increased information-sharing and decreased redundancy. Analysts and Monarch users alike can upload and download information that must be accessed by multiple individuals across the enterprise.

ANALYST ONLY SERVER ACCESS ONLY	MONARCH COMPLETE USER MONARCH ON THEIR DESKTOP & SERVER ACCESS
Consumer of completed reports only	Builder & Consumer of reports
Views reports in Content Server	Runs Monarch models & workspaces at the desktop level
Downloads Monarch outputs in Excel	Downloads PRF files from Content Server for analysis & further manipulation in Monarch
Does not work with PRF files	Builds new models & workspaces in Monarch
Will never build or tweak a Monarch model or workspace	Can edit existing Monarch models & workspaces
Does not do ad hoc work in Monarch	Does other ad hoc work with Monarch
Only consumes the output of Monarch models/workspaces others have built	Uses Monarch as an analytic tool (i.e. bring in a dataset and create summaries, apply filters, create calculated fields, etc.)
Does analytics with another solution and/or is satisfied with the output as stored in Content Server
